

TVWebHook 1.0.68

Quick Start Guide

1. Install Packages

```
pip install flask ccxt python-dotenv colorama waitress
```

2. Create Environment File

Create a file named **APIGoesHere.env** (or the name set in config) with:

```
PHEMEX_API_KEY=your_api_key  
PHEMEX_SECRET=your_api_secret
```

3. Edit configFile.json

Most important settings to change:

- PC_NAME – name of this computer
- SUBACCOUNT_NAME – name of the sub-account
- SANDBOX_MODE – true for testnet, false for live
- AUTO_SIZE_PERCENT – % of free balance (default 1.0)
- USE_TRADE_COOLDOWN – true / false
- COOLDOWN_BARS + COOLDOWN_TIMEFRAME_MINUTES

4. Start the Bot

```
python TVWebHook_68_Portable.py  
# or run TVWebHook_68_Portable.exe
```

The bot will show startup balance, positions, open orders, then wait for webhooks on port 5000.

5. TradingView Alert Message

Simple text:

```
buy BTC/USDT:USDT  
sell BTC/USD:BTC
```

JSON (force specific lot size):

```
{ "message": "buy BTC/USDT:USDT", "lotsize": 0.01 }
```

6. Important Behaviors

- No lotsize in webhook → Auto-Sizing (if on) or MIN_LOT_SIZE
- Lotsize present in webhook → that value is used (if SymLotOverride is true)
- New symbols are automatically added to the watch list
- Every log line shows [PC_NAME | SUBACCOUNT_NAME]
- Cooldown blocks new trades until the calculated wait time finishes
- Coin-margined symbols (BTC/USD:BTC) use a minimum size floor of 1 when needed
