

TVWebHook — Port 5000 Conflict Fix

Quick recovery guide when webhooks stop arriving

What the problem looks like

- Bot window shows **Waiting for TradingView alerts...** but nothing happens when an alert is sent
- curl / browser returns **500 Internal Server Error**
- Waitress prints many **Task queue depth** warnings
- Webhooks worked earlier, then suddenly stopped

Root cause

Two (or more) copies of the bot are both trying to use port **5000** on the same PC. Only one process can own a port cleanly. When they fight, requests get lost or crash.

Fix — step by step

1. Check what is using port 5000

Open Command Prompt and run:

```
netstat -ano | findstr :5000
```

You will see one or more lines with **LISTENING** and a PID number (process ID).

2. Kill every process on that port

For each PID you saw, run:

```
taskkill /PID 12345 /F
```

Replace **12345** with the real PID. Repeat for every PID that showed LISTENING.

Your bot window will close — that is expected.

3. Confirm the port is free

Run the check again:

```
netstat -ano | findstr :5000
```

You should see **nothing** (or only TIME_WAIT lines that disappear in a few seconds).

4. Start the bot once

Double-click the shortcut or run the .exe **only one time**. Wait until you see:

```
Waiting for TradingView alerts...  
INFO:waitress:Serving on http://0.0.0.0:5000
```

5. Test locally (safe)

In Command Prompt run:

```
curl -X POST http://127.0.0.1:5000 -H "Content-Type: text/plain" -d "buy BTC/USDT:USDT"
```

You should immediately see a webhook log appear in the bot window. If you do, the bot is healthy again.

Prevention rules

- Only **one** TVWebHook window open per computer
- Always close the old window before starting a new one
- After a crash or forced kill, always check the port is free before restarting
- If you need two bots on the same PC, give them different ports (5000 and 5001)

Remember: Multiple bots on different PCs is fine. Multiple bots fighting over the same port on one PC is what breaks webhooks.
